说说Zookeeper中的ACL - 就是你的博客 - 博客频道

Access Control在分布式系统中重要性是毋庸置疑的,今天这篇文章来介绍一下Zookeeper中的Access Control(ACL)。

• 1. 概述

传统的文件系统中,ACL分为两个维度,一个是属组,一个是权限,子目录/文件默认继承父目录的ACL。而在Zookeeper中,node的ACL是没有继承关系的,是独立控制的。 Zookeeper的ACL,可以从三个维度来理解:一是scheme; 二是user; 三是permission,通常表示为scheme:id:permissions, 下面从这三个方面分别来介绍:

- (1) **scheme**: scheme对应于采用哪种方案来进行权限管理, zookeeper实现了一个 pluggable的ACL方案,可以通过扩展scheme,来扩展ACL的机制。zookeeper-3.4.4缺省 支持下面几种scheme:
- world: 它下面只有一个id, 叫anyone, world:anyone代表任何人, zookeeper中对所有
 人有权限的结点就是属于world:anyone的
- auth: 它不需要id, 只要是通过authentication的user都有权限(zookeeper支持通过 kerberos来进行authencation, 也支持username/password形式的authentication)
- digest: 它对应的id为username:BASE64(SHA1(password)),它需要先通过
 username:password形式的authentication
- 。 **ip**: 它对应的id为客户机的IP地址,设置的时候可以设置一个ip段,比如 ip:192.168.1.0/16, 表示匹配前16个bit的IP段
- 。 super: 在这种scheme情况下,对应的id拥有超级权限,可以做任何事情(cdrwa)

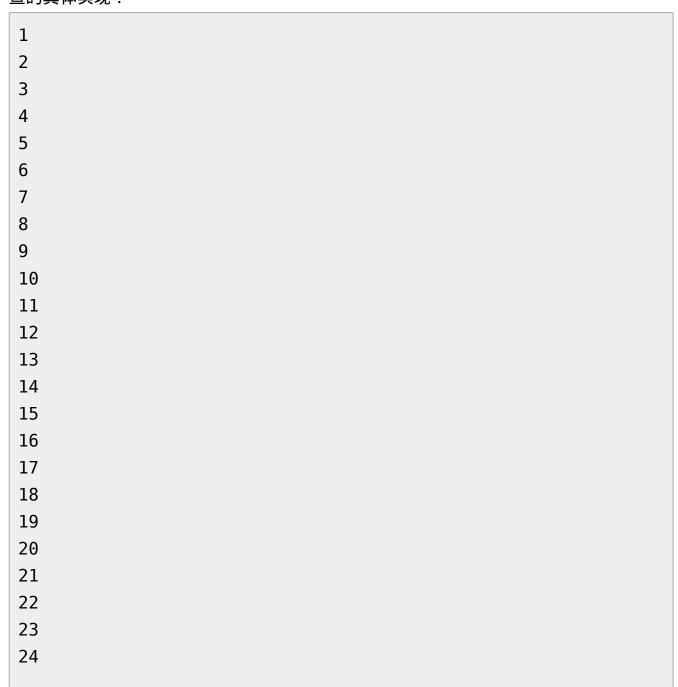

另外,zookeeper-3.4.4的代码中还提供了对sasl的支持,不过缺省是没有开启的,需要配置才能启用,具体怎么配置在下文中介绍。

- 。 **sasl**: sasl的对应的id,是一个通过sasl authentication用户的id,zookeeper-3.4.4中的 sasl authentication是通过kerberos来实现的,也就是说用户只有通过了kerberos认证,才能访问它有权限的node.
- (2) **id**: id与scheme是紧密相关的,具体的情况在上面介绍scheme的过程都已介绍,这里不再赘述。
- (3) permission: zookeeper目前支持下面一些权限:
- 。 CREATE(c): 创建权限,可以在在当前node下创建child node

- 。 DELETE(d): 删除权限,可以删除当前的node
- 。 READ(r): 读权限,可以获取当前node的数据,可以list当前node所有的child nodes
- 。 WRITE(w): 写权限,可以向当前node写数据
- 。 ADMIN(a): 管理权限,可以设置当前node的permission

• 2. 实现

如前所述,在zookeeper中提供了一种pluggable的ACL机制。具体来说就是每种scheme 对应于一种ACL机制,可以通过扩展scheme来扩展ACL的机制。在具体的实现中,每种 scheme对应一种AuthenticationProvider。每种AuthenticationProvider实现了当前机制下 authentication的检查,通过了authentication的检查,然后再进行统一的permission检查,如此便实现了ACL。所有的AuthenticationProvider都注册在ProviderRegistry中,新扩展的AuthenticationProvider可以通过配置注册到ProviderRegistry中去。下面是实施检查的具体实现:

```

   </span> KeeperException.
   <span style="color:rgb(0,102,51)">NoAuthException</span>
```

- ();
- 34. }

• 3. server配置

可以通过下面两种方式把新扩展的AuthenticationProvider注册到ProviderRegistry:

配置文件:在zookeeper的配置文件中,加入authProvider.\$n=\$classname即可

JVM参数:启动Zookeeper的时候,通过-Dzookeeper.authProvider.\$n=\$classname的方式,把AuthenticaitonProvider传入

在上面的配置中, \$n是为了区分不同的provider的一个序号, 只要保证不重复即可, 没有实际的意义, 通常用数字1, 2, 3等

• 4. 管理ACL

可以通过zookeeper client来管理ACL, zookeeper的发行包中提供了一个cli工具zkcli.sh,可以通过它来进行acl管理,下面通过一些例子来说明acl管理的基本方法:

•

```
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 2] create -s /test data sasl:test:cdr
Created /test000000370
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 3] getAcl /test0000000370
'sasl,'test
: cdr
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 4] create -s /test data ip:192.168.1.2:cdrw
Created /test0000000371
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 5] getAcl /test0000000371
'ip,'192.168.1.2
: cdrw
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 6] create -s /test data ip:192.168.1.2:cdrw,sasl:test:cdrwa
Created /test000000372
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 7] getAcl /test0000000372
'ip,'192.168.1.2
: cdrw
'sasl,'test
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 8] create -s /test data
Created /test0000000373
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 9] setAcl /test0000000373 ip:192.168.1.3:cdrwa
czxid = 0x1b00024ab5
ctime = Sun Jun 02 20:23:54 CST 2013
mZxid = 0x1b00024ab5
mtime = Sun Jun 02 20:23:54 CST 2013
pZxid = 0x1b00024ab5
cversion = 0
dataVersion = 0
aclVersion = 1
ephemeralOwner = 0x0
dataLength = 4
numChildren = 0
[zk: bjsd-zk-tst.hadoop.srv:11000(CONNECTED) 10] getAcl /test0000000373
 ip, '192.168.1.3
 cdrwa
```
